SWITCH LATCH

The best of both worlds

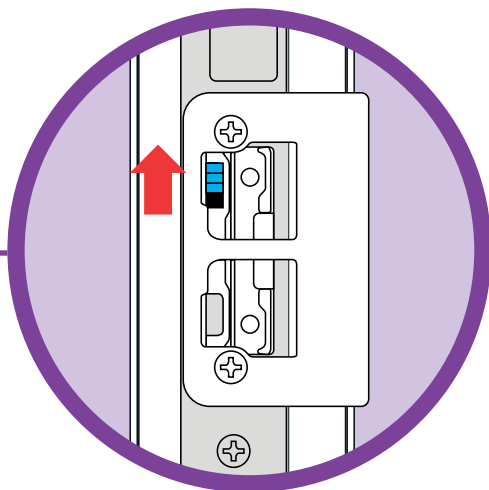

Your Rockdoor has been fitted with the new **Switch Latch**.

This means you can adjust the locking mechanism of your door to suit your lifestyle, without compromising your security.

Switch Latch allows you to set your lock so the latch can secure the door in place when opening and closing should you wish it to do so (in a similar way to how a split spindle or night latch operates), or alternatively you can set it so it can open and close freely like a roller latch.

This ensures the best of both worlds, by combining the benefits of a roller latch and split spindle in one smart innovation.

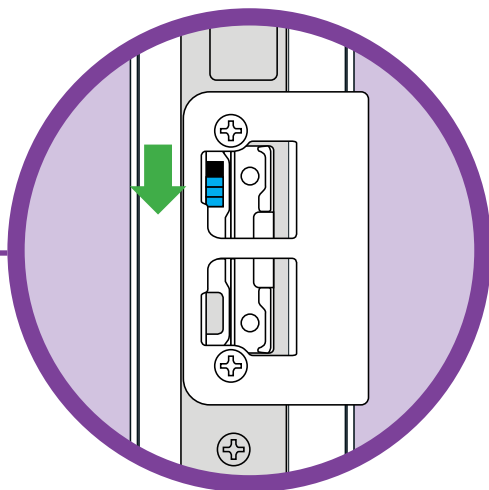

To secure your door fully, you'll still have to use your key internally (or thumbturn) or externally to fully engage the hook locks in position.

Up 

When the **Switch Latch** is in the **UP** position a key is required to gain entry to the property. Don't get caught out and lock yourself out.

For total security, the key or thumbturn still needs fully engaging to ensure the hook locks are secured in place.

Down 

When the **Switch Latch** is in the **DOWN** position no key is required allowing you to gain entry to the property and the door can open or close freely.

For total security, the key or thumbturn still needs fully engaging to ensure the hook locks are secured in place.
